The following python code will use the OS library to use Operating System libraries, giving you accord allowing you to unzip the data.

2020-03-12 17:46:05 (29.1 MB/s) - '/tmp/validation-horse-or-human.zip' saved [

```
import os
1
2
    import zipfile
3
4
    local zip = '/tmp/horse-or-human.zip'
5
    zip ref = zipfile.ZipFile(local zip, 'r')
    zip ref.extractall('/tmp/horse-or-human')
6
7
    local zip = '/tmp/validation-horse-or-human.zip'
    zip ref = zipfile.ZipFile(local zip, 'r')
8
    zip ref.extractall('/tmp/validation-horse-or-human')
9
    zip ref.close()
10
```

The contents of the .zip are extracted to the base directory /tmp/horse-or-human, which in turn Your session restarted after a crash. Diagnosing... X

In short: The training set is the data that is used to tell the neural network model that 'this is what a like' etc.

One thing to pay attention to in this sample: We do not explicitly label the images as horses or hun example earlier, we had labelled 'this is a 1', 'this is a 7' etc. Later you'll see something called an Im to read images from subdirectories, and automatically label them from the name of that subdirect directory containing a 'horses' directory and a 'humans' one. ImageGenerator will label the images Let's define each of these directories:

```
1
    # Directory with our training horse pictures
    train horse dir = os.path.join('/tmp/horse-or-human/horses')
 2
 3
    # Directory with our training human pictures
4
5
    train human dir = os.path.join('/tmp/horse-or-human/humans')
 6
 7
    # Directory with our training horse pictures
    validation horse dir = os.path.join('/tmp/validation-horse-or-human/horses')
8
9
    # Directory with our training human pictures
10
11
    validation human dir = os.path.join('/tmp/validation-horse-or-human/humans')
```

Now, let's see what the filenames look like in the horses and humans training directories:

```
train horse names = os.listdir(train horse dir)
 1
     print(train horse names[:10])
 2
 3
     train human names = os.listdir(train human dir)
 4
 5
     print(train human names[:10])
 6
7
     validation horse hames = os.listdir(validation horse dir)
     print(validation horse hames[:10])
8
9
10
     validation human names = os.listdir(validation human dir)
     print(validation human names[:10])
11
     ['horse11-2.png', 'horse27-3.png', 'horse07-1.png', 'horse43-5.png', 'horse01-
     ['human13-14.png', 'human03-20.png', 'human08-26.png', 'human15-28.png', 'huma
['horse2-269.png', 'horse5-076.png', 'horse1-241.png', 'horse2-224.png', 'hors
```

['valhuman03-24.png', 'valhuman05-09.png', 'valhuman01-17.png', 'valhuman04-21

Let's find out the total number of horse and human images in the directories:

```
print('total training horse images:', len(os.listdir(train_horse_dir)))
1
   print('total training human images:', len(os.listdir(train_human_dir)))
2
   print('total validation horse images:', len(os.listdir(validation horse dir)))
3
   print('total validation human images:', len(os.listdir(validation human dir)))
Your session restarted after a crash. Diagnosing... X
   total validation horse images: 128
   total validation human images: 128
```

Now let's take a look at a few pictures to get a better sense of what they look like. First, configure t

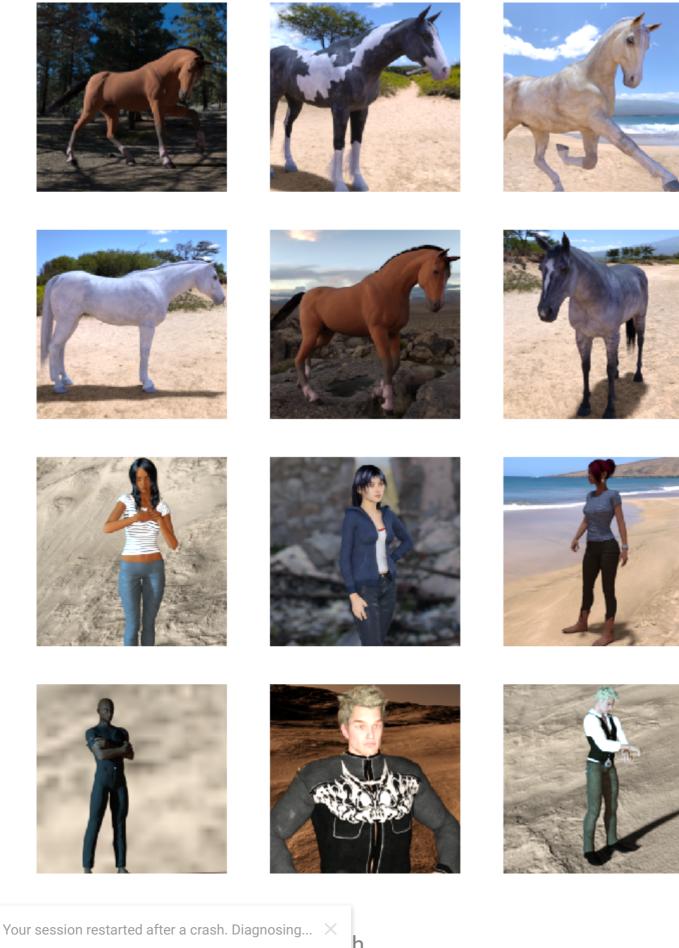

```
%matplotlib inline
2
    import matplotlib.pyplot as plt
3
    import matplotlib.image as mpimg
4
5
    # Parameters for our graph; we'll output images in a 4x4 configuration
6
7
    nrows = 4
8
    ncols = 4
9
10
    # Index for iterating over images
    pic index = 0
11
```

Now, display a batch of 8 horse and 8 human pictures. You can rerun the cell to see a fresh batch of

```
1
    # Set up matplotlib fig, and size it to fit 4x4 pics
 2
    fig = plt.gcf()
    fig.set size inches(ncols * 4, nrows * 4)
 3
 4
 5
    pic index += 8
    next horse pix = [os.path.join(train horse dir, fname)
 6
 7
                     for fname in train horse names[pic index-8:pic index]]
    next human pix = [os.path.join(train human dir, fname)
8
                     for fname in train human names[pic index-8:pic index]]
9
10
11
    for i, img path in enumerate(next horse pix+next human pix):
      # Set up subplot; subplot indices start at 1
12
13
      sp = plt.subplot(nrows, ncols, i + 1)
      sp.axis('Off') # Don't show axes (or gridlines)
14
15
      img = mpimg.imread(img path)
16
17
      plt.imshow(img)
18
19
    plt.show()
20
```

Your session restarted after a crash. Diagnosing... X

But before we continue, let's start defining the model:

Step 1 will be to import tensorflow.

1 import tensorflow as tf

The default version of TensorFlow in Colab will soon switch to TensorFlow 2.x. We recommend you upgrade now or ensure your notebook will continue to use TensorFlow 1.x via the %te

We then add convolutional layers as in the previous example, and flatten the final result to feed into

Finally we add the densely connected layers.

Note that because we are facing a two-class classification problem, i.e. a binary classification prob activation, so that the output of our network will be a single scalar between 0 and 1, encoding the (as opposed to class 0).

```
model = tf.keras.models.Sequential([
 1
 2
        # Note the input shape is the desired size of the image 300x300 with 3 by
 3
        # This is the first convolution
        tf.keras.layers.Conv2D(16, (3,3), activation='relu', input_shape=(300, 300)
 4
        tf.keras.layers.MaxPooling2D(2, 2),
 5
        # The second convolution
 6
        tf.keras.layers.Conv2D(32, (3,3), activation='relu'),
 7
        tf.keras.layers.MaxPooling2D(2,2),
8
9
        # The third convolution
10
        tf.keras.layers.Conv2D(64, (3,3), activation='relu'),
        tf.keras.layers.MaxPooling2D(2,2),
11
        # The fourth convolution
12
13
        tf.keras.layers.Conv2D(64, (3,3), activation='relu'),
14
        tf.keras.layers.MaxPooling2D(2,2),
15
        # The fifth convolution
        tf.keras.layers.Conv2D(64, (3,3), activation='relu'),
16
        tf.keras.layers.MaxPooling2D(2,2),
17
        # Flatten the results to feed into a DNN
18
        tf.keras.layers.Flatten(),
19
20
        # 512 neuron hidden layer
        tf.keras.layers.Dense(512, activation='relu'),
21
        # Only 1 output neuron. It will contain a value from 0-1 where 0 for 1 cla
22
        tf.keras.layers.Dense(1, activation='sigmoid')
23
   ])
24
```

WARNING:tensorflow:From /usr/local/lib/python3.6/dist-packages/tensorflow core Instructions for updating: If using Keras pass \*\_constraint arguments to layers.

The "output shape" column shows how the size of your feature map evolves in each successive lay the feature maps by a bit due to padding, and each pooling layer halves the dimensions.

Next, we'll configure the specifications for model training. We will train our model with the binary classification problem and our final activation is a sigmoid. (For a refresher on loss metrics, see th use the rmsprop optimizer with a learning rate of 0.001. During training, we will want to monitor

**NOTE**: In this case, using the <u>RMSprop optimization algorithm</u> is preferable to <u>stochastic gradient</u> learning-rate tuning for us. (Other optimizers, such as Adam and Adagrad, also automatically adap work equally well here.)

```
from tensorflow.keras.optimizers import RMSprop
Your session restarted after a crash. Diagnosing... X y',
                   metrics=['acc'])
```

WARNING:tensorflow:From /usr/local/lib/python3.6/dist-packages/tensorflow\_core Instructions for updating: Use tf.where in 2.0, which has the same broadcast rule as np.where

## Data Preprocessing

Let's set up data generators that will read pictures in our source folders, convert them to float32 our network. We'll have one generator for the training images and one for the validation images. Or size 300x300 and their labels (binary).

As you may already know, data that goes into neural networks should usually be normalized in son processing by the network. (It is uncommon to feed raw pixels into a convnet.) In our case, we will pixel values to be in the [0, 1] range (originally all values are in the [0, 255] range).

In Keras this can be done via the keras.preprocessing.image.ImageDataGenerator class usir ImageDataGenerator class allows you to instantiate generators of augmented image batches (a .flow from directory(directory). These generators can then be used with the Keras model: inputs: fit generator, evaluate generator, and predict generator.

```
from tensorflow.keras.preprocessing.image import ImageDataGenerator
 1
 2
 3
    # All images will be rescaled by 1./255
    train datagen = ImageDataGenerator(rescale=1/255)
 4
    validation datagen = ImageDataGenerator(rescale=1/255)
 5
6
 7
    # Flow training images in batches of 128 using train datagen generator
    train generator = train datagen.flow from directory(
8
            '/tmp/horse-or-human/', # This is the source directory for training:
9
            target size=(300, 300), # All images will be resized to 150x150
10
            batch size=128,
11
12
            # Since we use binary crossentropy loss, we need binary labels
13
            class mode='binary')
14
    # Flow training images in batches of 128 using train datagen generator
15
    validation generator = validation datagen.flow from directory(
16
            '/tmp/validation-horse-or-human/', # This is the source directory for
17
18
            target size=(300, 300), # All images will be resized to 150x150
19
            batch size=32,
            # Since we use binary_crossentropy loss, we need binary labels
20
21
            class_mode='binary')
```

Found 1027 images belonging to 2 classes. Found 256 images belonging to 2 classes.

Your session restarted after a crash. Diagnosing... X

Let's train for 15 epochs -- this may take a few minutes to run.

Do note the values per epoch.

The Loss and Accuracy are a great indication of progress of training. It's making a guess as to the measuring it against the known label, calculating the result. Accuracy is the portion of correct gue

## Visualizing Intermediate Representations

To get a feel for what kind of features our convnet has learned, one fun thing to do is to visualize h through the convnet.

Let's pick a random image from the training set, and then generate a figure where each row is the a specific filter in that output feature map. Rerun this cell to generate intermediate representations

```
1  import numpy as np
Your session restarted after a crash. Diagnosing... × age import img_to_array, load_img
5  # Let's define a new Model that will take an image as input, and will output
6  # intermediate representations for all layers in the previous model after
7  # the first.
8  successive_outputs = [layer.output for layer in model.layers[1:]]
https://colab.research.google.com/github/lmoroney/dlaicourse/blob/master/Course 1 - Part 8 - Lesson 3 - Notebook.jpynb#scr... 10/13
